## STAT 516 - Spring 2004 - Homework 4 Solutions

Pg. 279: \#1 False. If for two samples the conclusions from an ANOVA and test disagree, you shoust made a mistake! (see bottom of page 230 and top of 231... they must be the same)

Pg. 279: \#2 True. Since F=MSB/MSW, if MSW is smaller, the F is larger and we would reject more often.
Pg. 279: \#12

| Source | df | SS |
| :--- | :--- | :--- |
| Between Factors | 2 | 810 |
| Within (error) | 8 | 720 |

False: The null hypothesis is that all three means are equal.
False: $\mathrm{F}=\mathrm{MSB} / \mathrm{MSW}=(810 / 2) /(720 / 8)=405 / 90=4.5 \quad(1.125$ is $\mathrm{SSB} / \mathrm{SSW})$
False: The critical value for F for $5 \%$ significance is 4.46 . (Table A.4A on page 627)
True: It can be rejected at 5\% significance because the observed 4.5 is greater than the critical value of 4.46.
True: The null hypothesis cannot be rejected at $1 \%$ significance because the observed 4.5 is less than the critical value of 8.65 .

False: There are $10 \underline{11}$ observations in the experiment. (total $\mathrm{df}=8+2=$ sample size minus 1 )

## 2a) Write down the equation of the one-way ANOVA model that is described by this set-up. Be sure to clearly identify each parameter and the sample sizes.

Following page 233, the section called "The Linear Model for Several Populations" we could writte
$\mathrm{y}_{i j}=\mu_{i}+\varepsilon_{i j}$ where the $\mathrm{y}_{i j}$ and $\varepsilon_{i j}$ are the observed scores and errors respectively for the $j$ th observer for face $i$. $\mu_{i}$ is the average dominance score for that facial expression. The $i$ faces are $1=$ Angry, $2=$ Disgusted, $3=$ Fearful, $4=$ Happy, $5=$ Sad, $6=$ Neutral; and, $j$ goes from 0 to 6 (six observers for each face).

Using the section on page 233 called "The Analysis of Variance Model" we would have split the $\mu_{i}$ into an overall average and treatment effects $\left(\tau_{i}\right)$.

```
DATA faces;
INPUT emotion $ rating @@;
CARDS;
Angry 2.10 Angry 0.64 Angry 0.47 Angry 0.37 Angry 1.62 Angry -0.08
Disg 0.40 Disg 0.73 Disg -0.07 Disg -0.25 Disg 0.89 Disg 1.93
Fear 0.82 Fear -2.93 Fear -0.74 Fear 0.79 Fear -0.77 Fear -1.60
Happy 1.71 Happy -0.04 Happy 1.04 Happy 1.44 Happy 1.37 Happy 0.59
Sad 0.74 Sad -1.26 Sad -2.27 Sad -0.39 Sad -2.65 Sad -0.44
Neut 1.69 Neut -0.60 Neut -0.55 Neut 0.27 Neut -0.57 Neut -2.16
;
PROC INSIGHT:
OPEN faces;
FIT rating=emotion;
RUN;
PROC GLM DATA=faces ORDER=DATA;
CLASS emotion;
MODEL rating=emotion;
MEANS emotion / HOVTEST=BF;
RUN;
```

b) Check that the assumptions for performing a one-way ANOVA hold, including using Levene's test.

|  |  | Sum of | Mean |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Source | DF | Squares | Square | F Value | $\mathrm{Pr}>\mathrm{F}$ |
| emotion | 5 | 1.6184 | 0.3237 | 0.67 | 0.6477 |
| Error | 30 | 14.4467 | 0.4816 |  |  |

1) Since the students were randomly divided into the six groups, the errors are independent.
2) The means of the errors are always 0 in a one-way ANOVA (or could look at residual vs. predicted plot)
3) The errors appear to be normally distributed as the q-q plot is very close to a straight line.
4) It is not clear from the residual versus predicted plot if the variance of the errors is constant, but with a pvalue of 0.6477 in the modified Levene's test we accept that the variances of the errors are equal.
c) What hypothesis is being tested by the F-statistic in the ANOVA table? State your conclusion at the $\alpha=0.05$ level.

|  | Analysis of Variance |  |  |  |  |
| :--- | :---: | ---: | :---: | :---: | :---: |
| Source | DF | Sum of Squares | Mean Square | F Stat | Pr $>$ F |
| Model | 5 | 23.0852 | 4.6170 | 3.96 | 0.0071 |
| Error | 30 | 34.9870 | 1.1662 |  |  |
| C Total | 35 | 58.0722 |  |  |  |

$\mathrm{H}_{0}: \mu_{\text {Angry }}=\mu_{\text {Disgusted }}=\mu_{\text {Fearful }}=\mu_{\text {Happy }}=\mu_{\text {Sad }}=\mu_{\text {Neutral }}$
$\mathrm{H}_{\mathrm{A}}$ : At least one is different
At $\alpha=0.05$ we reject $\mathrm{H}_{0}$ because the p -value of 0.0071 is less than $\alpha$.
d) Use the Holm procedure with an experiment-wise (family-wise) $\alpha_{T}=\mathbf{0 . 0 5}$ level to test all of the pair-wise differences, and make a display showing the ranking in which the different facial expressions reflect dominance.

| PROC MULTTEST DATA=faces ORDER=DATA HOLM; CLASS emotion; |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| CONTRAST | 'Ang vs Dsg' 1 | $\begin{array}{lllll}-1 & 0 & 0 & 0 & 0\end{array}$ |  |  |
| CONTRAST | 'Ang vs Fer' 1 | 0-1 0 0 0; |  |  |

| rating |  | Ang vs Sad | 0.0048 | 0.0674 |
| rating |  | Ang vs Neu | 0.0696 | 0.5567 |
| rating |  | Dsg vs Fer | 0.0394 | 0.3935 |
| rating |  | Dsg vs Hap | 0.5124 | 1.0000 |
| rating |  | Dsg vs Sad | 0.0128 | 0.1540 |
| rating |  | Dsg vs Neu | 0.1484 | 1.0000 |
| rating |  | Fer vs Hap | 0.0085 | 0.1103 |
| rating |  | Fer vs Sad | 0.6264 | 1.0000 |
| rating |  | Fer vs Neu | 0.5074 | 1.0000 |
| rating |  | Hap vs Sad | 0.0024 | 0.0366 |
| rating |  | Hap vs Neu | 0.0400 | 0.3935 |
| rating |  | Sad vs Neu | 0.2541 | 1.0000 |
| Happy |  | 1.0183 | A |  |
| Angry |  | 0.8533 | A B |  |
| Disg |  | 0.6050 | A B |  |
| Neut |  | -0.3200 | A B |  |
| Fear |  | -0.7383 | A B |  |
| Sad |  | -1.0450 | B |  |

We can only tell that happy and sad are different... and that's all.
e) Use a contrast to make a $95 \%$ confidence interval for the difference in dominance between the average of the two strong negative emotions (Angry and Disgusted) and the positive emotion (Happy).

```
PROC GLM DATA=faces ORDER=DATA;
CLASS emotion;
MODEL rating=emotion;
ESTIMATE 'strongneg vs pos' emotion 1 1 0 -2 0 0 / divisor=2;
RUN;
\begin{tabular}{|c|c|c|c|c|c|}
\hline \multicolumn{6}{|c|}{Sum of} \\
\hline Source & DF & Squares & Mean Square & F Value & \(\mathrm{Pr}>\mathrm{F}\) \\
\hline Model & 5 & 23.08522222 & 4.61704444 & 3.96 & 0.0071 \\
\hline Er36ror & 30 & 34.98700000 & 1.166233 & & \\
\hline Corrected Total & 35 & 58.07222222 & & & \\
\hline & & & Standard & & \\
\hline Parameter & & i mate & Error & \(t\) Value & \(\operatorname{Pr}>|t|\) \\
\hline strongneg vs pos & - 0 . & 8916667 & 0.53996142 & -0. 54 & 0.5962 \\
\hline
\end{tabular}
```

So, we get the $95 \%$ confidence interval for $\left(\mu_{\text {angry }}+\mu_{\text {disgusted }}\right) / 2-\mu_{\text {happy }}$ is
$\hat{L} \pm t_{0.025, d f=30} \hat{\sigma}_{\hat{L}}=-0.28917 \pm 2.0423(0.53996)=-0.28917 \pm 1.10276=(-1.39,0.81)$
where a negative number means that the positive emotion is more dominant, and a positive number means the negative emotions are more dominant.
